SCIENCE NEWS

YOU'VE heard of packs of wolves and pods of killer whales. Now you can add parties of eels to the list of animals that hunt in gangs.

Scientists working on the banks of the Iriri River in the Brazilian Amazon River basin discovered a small lake filled with more than 100 large adult electric eels. Many of them were at least 120 _ _ _ _ long.

This was a curious finding, as electric eels were thought to prefer being alone. But what the team spotted next was even more _ _ _ _ : the eels were working together in a large circle to herd thousands of small fish called tetras into tightly-packed balls.

Once they had done that, groups of up to ten eels split off to form hunting parties.

These smaller groups then surrounded the ball of tetras and launched _ _ _ _ electric _ _ _ e. The electric shocks they fired sent the tetras flying out of the water. When they splashed back down, the tiny fish were _____ and unable to move. At that point, the

hunting party easily picked off their prey.

The eel hunting pa were found to only ____at dus dawn. Each hunting lasted around an h

involved between

For most of the o be lying almost ent surface to breathe
